

Amendments to the Claims:

1. (Currently Amended) A storage apparatus comprising:
a body defining at least one accessory receiving slot;
at least one clamping member displaceable relative to the receiving slot to move between a first position permitting a storage item to be received between the body and clamping member and a second portion for retaining a storage item received between the body and the clamping member; and
an actuator biasing the at least one clamping member and being selectively pivotal ~~operable~~ to move the at least one clamping member toward the second position and to provide a clamping force to an item received between the body and the clamping member.
2. (Cancelled).
3. (Previously Presented) The storage apparatus of claim 1 wherein the receiver includes cushioning material for contacting a surface of the storage item when the clamping force is applied to the storage item.
4. (Original) The storage apparatus of claim 1 wherein the actuator includes a lock for retaining the actuator in a position for moving the clamping member to the second position.
5. (Original) The storage apparatus of claim 4 wherein the lock is selectively releaseable.
6. (Currently Amended) A storage apparatus comprising:
a body;
a plurality of clamping members, the body and clamping members defining a respective plurality of receivers for receiving items for storage, the clamping members having a first position permitting a storage item to be received between the body and each clamping member, and being displaceable relative to the body to retain a the storage item received between the body and the clamping member; and
an actuator for selecting the position of each of the clamping members member.

7. (Original) The apparatus of claim 6 wherein the actuator cooperates with each clamping member to distribute bias force to the clamping members.

8. (Currently Amended) The apparatus of claim 6 wherein the actuator cooperates to provide a bias towards a selected position for the clamping members member.

9. (Currently Amended) The apparatus of claim 8 wherein the actuator includes a lock for retaining the actuator in a position for biasing the clamping members member to retain a storage item between the body and the second position.

10. (Original) The apparatus of claim 9 wherein the lock is selectively releaseable.

11. (Canceled).

12. (Canceled).

13. (Canceled).
